Claim 1; Page 330; Opp; English

monitoring

The invention relates to a system for detecting gene expression, which

```
ö
               gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukcyve expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognessis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   17; leukocyte; gene expression profiling; allograft rejection;

This invention relates to novel methods for diagnosing and monitoring autoimmune and chronic inflammatory diseases. Specifically, it refers to the identification of genes that have a clinical utility as diagnostic tools for the management of, in particular, patients with systemic lupus erythematosis (SLE) or rheumatoid arthritis (RA). Accordingly, the present invention describes a method for determining the levels of multiple differentially expressed genes of a patient, in a concerted manner, in order to achieve an improved diagnostic assay with sensitivity and specificity for the disease in question. As such, these genes are useful for the diagnosis of various other inflammatory disorders including cholecystitis, sjogren's disease, CREST syndrome, sclerosing cholangitis, appendicitis, diverticulitis, and primary sclerosing ankylosing spondylitis, ulcerative colitis, primary sclerosing cholangitis, appendicitis, diverticulitis, and primary biliary sclerosis. This oligonucleotide is a human DNA probe used to monitor the expression level of the differentially expressed diagnostic genes of the invention.
                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Diagnosing or monitoring autoimmune and chronic inflammatory diseases, such as rheumatoid arthritis, systemic lupus erythematosus, ulcerative colitis, psoriasis and asthma by detecting the expression level of one or more genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human DNA probe used to monitor expression of diagnostic genes SeqID761.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          human; ss; autoimmune; chronic inflammatory disease; SLE; systemic lupus erythematosis; rheumatoid arthritis; cholecystitis; Sjogran; s disease; CRST syndrome; scleroderma; ankylosing spondylitis; ulcerative colitis; primary sclerosing cholangitis; appendicitis; diverticulitis; primary biliary sclerosis; probe.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, xenotransplant rejection or mechanical organ replacement rejection, in an individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoria arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIVAIDS or viral, bacterial or fungal infection. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ral, bacterial or fungal infection. The present sequence represents a mer oligonucleotide marker for diagnosis and monitoring of allograft
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Morris M;

Such antibodies or functional fragments can be used as immunoactivators, anti-tumour agents, immunosuppressants, and as remedies for autoimmune diseases, alleryy or coagulation factor VIII inhibitors syndrome. This polynucleotide sequence represents an oligo relating to

The inventor interacts to producing a Bundpoint applied indicated and a conditions to enzymatically generate sub-population of Nas, where each gene specific primers under suitable conditions to enzymatically generate sub-population of Nas, where each gene specific primer has a sequence complementary to a distinct mRNA, and each labeled NA is generated using a single gene specific primer. The method is useful for malysing the difference in the RNA profiles between several different physiological sources, where the method comprises producing to subpopulation of labeled NAs for the different physiological sources, comprising the populations for each physiological sources, comprising the population where the comparison is preferably difference in the population, where the comparison is preferably difference by hybridising the labeled NAs for each of the distinct physiological sources to an array of probe NAs stably associated with the surface of a substrate to produce a hybridisation pattern for each of the sources, where differential gene expression assays are utilised in differential expression analysis of diseased a normal tissue e.g. neoplastic a normal expression analysis of diseased a normal tissue e.g. neoplastic a normal comparing the patent did not form part of the printed the sequence data for this patent did not form part of the printed the specification, but was obtained in electronic format directly from USPTO
                                                                                                                                                                                                                                                                                                                Producing sub-population of labeled nucleic acids, useful for analyzing differences in RNA profiles between several different physiological sources, using set of distinct gene specific primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                  invention relates to producing a sub-population of labeled nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Primer; 88; DNA microarray; differential expression analysis; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

Tumour necrosis factor (TNF) receptor has an important role in the regulation of cellular proliferation, differentiation, and apoptosis in firlammatory and immune responses. The present invention relates to a quantitative assay for measuring the ability of a substance to effect binding of a TNF receptor-associated factor (TRAF) protein to its receptor. CD40 is a TRAF2 receptor. The present sequence is a PCR primer used to amplify amino acids 216 to 277 of human CD40 cytoplasmic domain (CD40c). Peptide antagonists of CD40c-TRAF2 binding were identified by the present invention (AAB07004 to AAB07010)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ds; immunosuppressive; antiinflammatory; antiallergic; cardiovascular-Gen; antiinflammatory; antibacterial; antibacterial; antimatic; offormatic; dermatological; antipacialtic; antishmatic; neuroprotective; antiathmatic; antidiabetic; antiateriosclerotic; neuroprotective; antiathmatic; antidiabetic; antiateriosclerotic; neuroprotective; nespiratory-Gen; gastrointestinal-Gen; gene therapy; human; CD40 receptor; organ transplant rejection; inflammation; lymphocyte co-stimulation; allergy; autoimmune disorder; cardiovascular disorder; rheumatoid state; cancer; allergic dermatitis; psoriasis; arteriosclerosis; multiple sclerosis; pulmonary fibrosis; asthma; diabetes; Lyme disease; crohn's disease; ulcerative colitis; luques; thyroiditis; arthritis; leukemia; lymphoma; neurodegenerative disease; small interfering RNA; sirNA; gene expression; gene silencing.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to producing a sub-population of labeled nucleic acids (NAs) comprising contacting a NA sample from a physiological cource, with a pool of 50 distinct gene specific primers under suitable conditions to enzymatically generate sub-population of NAs, where each gene specific primers under suitable conditions to enzymatically generate sub-population of Iabeled NAs is generated using a single gene specific primer. The method is useful for producing a sub-population of labeled NAs which is useful for analysing the differences in the RNA profiles between several different physiological sources, where the method comprises producing subpopulation of labeled NAs for the different physiological sources, comprising the populations for each physiological source of a substrate to produce a hybridisation pattern for each of the distinct physiological sources to an array of probe NAs stably associated with the surface of a substrate to produce a hybridisation pattern for each of the sources, where confiferential gene expression ansays are utilised in differential comparing the patterns for each of the sources, where confiferent tissue or subtissue types. The present sequence is a confiferent space of a normal tissue, or different tissue or subtissue types. The present sequence is a configuration, but was obtained in electronic format directly from USPTO cat http. wipo.seqdata.uspto.gov/sequence.html?DocID=635282981
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, TRAP protein, Tumour-necrosis factor; TNF; CD40; PCR primer; 88;
TNF receptor-associated factor; cell proliferation; cell differentiation;
apoptosis; inflammation; immune response; receptor-ligand binding assay.
                                                                                                                                                                                                                                                                                                            Producing sub-population of labeled nucleic acids, useful for analyzing differences in RNA profiles between several different physiological sources, using set of distinct gene specific primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                   The invention relates to oligoribonucleotide (ONI) homologous with the 241-259 region of the CDDA (I) that encodes the human CD40 receptor, published as GenBank X60592. ONI, also their subsequences and derived duplexes (all optionally chemically modified), are useful for treatment of rejection of transplanted organs or tissues; acute and chronic inflammation; processes that involve co-stimulation of lymphocytes; allergic, autoimmune or cardiovascular disorders; infections; rheumatoid arteriosclerosis; multiple sclerosis; pulmonary fibrosis; viral and bacterial infection; asthma; type I diabetes; Lyme and Crohn diseases; ulcerative colitis; lupus; thyroidiis; arthritis; leukemia and lymphoma;
                                                                                                                  New oligoribonucleotides specific for the human CD40 receptor, useful for treating e.g. transplant rejection, inflammation and autoimmune diseases, also related duplexes and gene transfer vectors.
                                                                                                                                                                                                                                                                                                                   also neurodegenerative diseases. This sequence corresponds to one of the small interfering RNA (siRNA) molecules used as an example of the oligonucleotides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ss; binding domain; cell-surface molecule; tumour necrosis factor; TNF ligand family; TRAIL; TNF receptor superfamily; cytostatic; antiinflammatory; immunosuppressive; antirhemmatic; antiarthritic; neuroprotective; antidiabetic; protozoacide; virucide; antibacterial; antiallergic; signalling cascade; apoptosis; immunomodulation; cancer; metabolic disease; multiple sclerosis; diabetes mellitus;

This invention describes a novel polypeptide which comprises a segment that contains a binding domain for a cell-surface molecule; a peptide that contains a binding domain for a cell-surface molecule; a peptide corrosis factor (FWE) ligand (TRAIL) family that, alone, is inactive or necrosis factor (FWE) ligand (TRAIL) family that, alone, is inactive or manited activity. The binding domain is not derived from an complex conjugates of immunoglobulin and the FRAIL fragment becomes fully active only after immunoglobulin and the FRAIL fragment becomes fully active only after complex compl
                                                                                                                                                                          New fusion polypeptide, useful for treating e.g. cancer, infections and inflammation, comprises binding domain for cell-surface molecule and fragment of tumor necrosis factor ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ss; binding domain; cell-surface molecule; tumour necrosis factor; TNF ligand family; TRAIL; TNF receptor superfamily; cytostatic; antinflammatory; immunosuppressive; antirheumatic; antiarthritic; neuroprotective; antidiabetic; protozoacide; virucide; antibacterial; antiallergic; signalling cascade; apoptosis; immunomodulation; cancer; metabolic disease; multiple sclerosis; diabetes mellitus; transplant rejection.

Human, TRAF protein, Tumour-necrosis factor, TNF, CD40, PCR primer, ss, TNF receptor-associated factor, cell proliferation, cell differentiation, apoptosis, inflammation, immune response, receptor-ligand binding assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tumour necrosis factor (TNF) receptor has an important role in the regulation of cellular proliferation, differentiation, and apoptosis in inflammatory and immune responses. The present invention relates to a quantitative assay for measuring the ability of a substance to effect binding of a TNF receptor-associated factor (TRAF) protein to its receptor. CD40 is a TRAF2 receptor. The present sequence is a PCR primer used to amplify amino acids 216 to 277 of human CD40 cytoplasmic domain (CD40c). Peptide antagoniers of CD40c-TRAF2 binding were identified by the present invention (AAB07004 to AAB07010)
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Quantitative assay for measuring the effect of a substance on tumor necrosis factor receptor associated factor protein interaction with it
                                                                                                                                                                                                                                                                                                                         (BOEH ) BOEHRINGER INGELHEIM PHARM INC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 1; Page 7; 27pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel polypeptide which comprises a segment that contains a binding domain for a cell-surface molecule; a peptide that contains a bending domain for a cell-surface molecule; a peptide linker and a segment that contains a fragment of a member of the tumour necrosis factor (TNF) ligand (TRALL) family that, alone, is inactive or nemunoglobulin and the TRALL) family that, alone, is inactive or immunoglobulin and the TRALL fragment becomes fully active only after immunoglobulin and the TRALL fragment becomes fully active only after frament is the extracellular domain (or its functional variants or fragment is the extracellular domain (or its functional variants or fragment is the extracellular domain (or its functional variants or fragments) of a TWF family ligand, sepecially TRALL, Fas. TWF 11gand (or its functional variants) or is at least the essential part of a ligand for a membrane-bound receptor, specifically where the ligand is a peptide or protein hormone (especially of a growth factor, e.g. epidermal growth factor, or an angiogenic agent, the binding domain is derived from a receptor, especially of the TWF receptor superfamily, e.g. TWF 22, CD30, CD40 or CD28, for a membrane-bound ligand in provided that it does not bind to the extracellular domain of the invention have cytostatic, antiinflammatory, immunosuppressive, antiinflammatory, immunosuppressive, antiinflammatory, antichabetic, antiinflammatory, antichabetic, antiinflammatory, antichabetic, antiinflammatory and autoinmune diseases, inflammation and autoinmune diseases, continues), metabolic diseases, inflammation and autoinmune diseases, especially induction of supprobes and immunomodulation. The peticot of the invention, also mucleic acid constructs vectors and cells that the part of diseases, also multiple selerosis, currents and extended the rWF family ligand is developed in transplant rejection. The effect of the rWF family ligand is developed in effects are avoided, or at least much reduces.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                    New fusion polypeptide, useful for treating e.g. cancer, infections and inflammation, comprises binding domain for cell-surface molecule and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                  The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, e.g. necknown replacement rejection, and individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatord arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a probe for a 50 mer oligonocleotide marker for diagnosis and monitoring of

the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, and evaluating a set of oligonucleotides (the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of the compounds with the tNA according to defined criteria, and described are: (1) a method of the compounds with the tNA sequence comprising generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria, and (2) a method of defining a set of compounds that modulate the expression of a tNA sequence via binding of the compounds with the tNA. The methods can be used for the generation and identification of synthetic compounds having defined physical, chemical or bioactive properties. Information gathered from assays of such compounds is used to identify nucleic acid sequences that are tractable to a variety of nucleotide sequence-based technologies, e.g. antisense drug discovery and target validation. AAZ40852 to AAZ41220, and AAX52701 to AAX52706, represent sequences used in the exemplification of the present invention

                                                                                                                                                                                                                                                                         ö
                                                              Anymoro to main the continuous antibuted the continuous antibuted the expression of human CD40. Which can be used to inhibit the expression of human CD40. CD40 is involved in lymphocyte activation, the mount growth and/or angiogenesis. Inhibition of CD40 is used to treat or prevent immune-associated diseases (specifically guest vs. host disease, allograft rejection or autoimmune diseases); inflammation (specifically disease or psoriasis) or hyperproliferation (specifically disease or psoriasis) or hyperproliferation (specifically cancer and tummours), the antisense oilgonucleotides are also useful as diagnostic and research reagents. AAZ47770 to AAZ47772 represent human CD40 forward and reverse PCR primers, and a human CD40 PCR probe, respectively. AAZ47773 to AAZ47775 represent other PCR primers and a probe used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Selecting a target molecule having affinity for a ligand that is equal to/greater than a baseline affinity by introducing a target molecule into a ligand and standard target test mixture and identifying complex by mass
Antisense molecules directed against nucleic acid encoding human CD40, for treating e.g. immune, inflammatory or hyperproliferative diseases.
                                                                                                                                                                                                                                                                        Gaps

Control invention relates to selecting a target molecule that has an arithicy comprises introducing a target molecule into a tester mixture of the ligand cand a standard target, introducing the test mixture into a mass spectrometer and identifying any complexes of the target molecule and the ligand and a standard target, introducing the test mixture into a mass spectrometer and identifying any complexes of the target molecule and the ligand also included are a method of detecting a ligand-target complex laying an affinity as expressed as a dissociation constant of nanomolar. Industry as expressed as a dissociation constant of nanomolar conformation of millimolar, a method for determining the relative interaction between a first target molecule with respect to a ligand, a method of determining the relative proximity of binding sites for a first target molecule when second target molecule with respect to a ligand, a method for screening the binding affairity of a first target molecule to a ligand, a method for modulating the binding of a target molecule for a ligand, a method for modulating the binding of a farget molecule to a ligand, a method for modulating the binding of a target molecule to a ligand, a method for determining the relative of an oligomer, a method for identifying a ligand and a second ligand on a target conjudicant to filluenced by the first ligand, a method of determining the relative change in proximity of a first ligand and a second ligand on a target to a notificant to filluenced by the first ligand, a method of determining to a target substrate influenced by the first ligand, a method of determining to a compute second binding site for a second binding ligand on a target conjudicance in proximity of a first ligand, a method of determining to a compute sequence of a larget substrate, and oligomeric compound computence of a larget of compound computence of a larget of compound to a precursor should be adjudent of a farget of a method of determining a molectide sequence of a larget of method 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
The invention relates to selecting a target molecule that has an affinity for a ligand that is equal to or greater than a baseline affinity,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            interfering RNA) and antisense oligonucleotides. The method is useful for determining the mode of binding interaction between two or more target molecules to the ligand as well as their relative affinities. The oligomeric compounds are useful in drug discovery and target validation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             diagnostics, therapeutics, prophylaxis and as research reagents and kits. The present sequence is an RT-PCR (reverse transcriptase PCR) probe for human CD40 mRNA used to assess expression of CD40 during treatment with

This invention describes a novel antigen-presenting, preferably subcellular, vesicle comprising molecules on its surface for first, and subcellular, vesicle comprising molecules on its surface for first, and preferably second, signals for antigen-specific activation of T I with signals for antigen-specific activation of Such the invention have cytostatic and immunostimulant activity and are used in vaccines, particularly where the HLA and peptide components are matched to a particularly where the HLA and peptide components are associated antigen against which T cells are to be activated, or are from an allergen or autoantigen against which anergy is required. Particularly the vesicles are used to treat, or screen, tumours, to induce an immune response to a weak antigen, for analysis of new costimulatory, adhesion or other molecules, for controlled release of messengers and/or growth factors contained within its lumen and as a platform for preparing multivalent brinding reagents, e.g. for antigen-specific characterisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
antigen-presenting vesicle; subcellular; T lymphocyte; anergisation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antigen-presenting vesicles, useful for treating, e.g. tumors, comprises surface molecules that signal antigen-specific activation or anergization of T cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1467-05 oligonucleotide, to generate human met-Fc-OPG fusion construct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, fusion protein, osteoprotegerin, OPG; Fc protein; osteopathic, therapy; bone loss, osteoprosis; Paget's disease, osteomyelitis, hypercalcaemia, osteopenia, osteonecrosis; rheumatoid arthritis; osteolytic metastasis; prosthetic loosening; immunoglobulin G1; IgG1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a primer used to generate the

                                                                                                                                                                                                                                                                                 The patent discloses fusion protein comprising human osteoprotegerin (OPG) protein fused by linker to human 1gG1 Fc portion. OPG negatively regulates formation of osteoclasts in vitro and in vivo. It blocks the differentiation of osteoclasts from monocyte or macrophage precursors and the reabsorption of bone. The OPG-Fc fusion protein are administered for the treatment of bone loss resulting from osteoporosis, Paget's disease, osteomyellits, hypercalcaemia, osteopenia associated with surgery or steroid administration, osteomerosis, bone loss due to rheumatoid arthritis, periodontal bone loss, osteolytic metastasis and/or prosthetic lossening. The present DNA sequence is 1467-05 oligonucleotide which is used to generate human met-Fc (lacking 1-5 residues)-OPG (22-194
                                                                                                                                                                                                         Osteoprotegerin-Fc protein fusions useful for treating bone loss caused by e.g. osteoporosis, Paget's disease and osteomyelitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CD40 transmembrane domain; CD40 cytoplasmic domain; CD40; CD40t/c; PCR;

                                                                                             The present invention relates to a method for identifying members of specific binding pairs. The method comprises providing a cell which is susceptible to apoptosis, expressing in the cell a first binding pair member (FBM) fused to apoptosis inhibitor, exposing the cell to an apoptosis inducing agent and contacting the cell with a second binding pair member (SBM), where members of specific binding pairs are identified by binding of FBM to SBM, such that apoptosis inhibitor is activated to inhibit apoptosis. The method is useful for screening human cDNA libraries for traget antigens e.g., tumour epitopes. Preferably, the FBM are expressed as fusion proteins with the signalling portion (the transmembrane and cytoplasmic) of CD40 (CD40L/c). The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method for identifying members of specific binding pairs. The method comprises providing a cell which is susceptible to apoptosis, expressing in the cell a first binding pair member (FBM) tused to apoptosis inhibitor, exposing the cell to an apoptosis inducing agent and contacting the cell with a second binding pair member (SBM), where members of specific binding pairs are identified by binding of FBM to SBM, such that apoptosis inhibitor is activated to inhibit apoptosis. The method is useful for screening human cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying members of specific binding pairs in cell expressing first binding pair member (FBM) fused to apoptosis inhibitor by identifying inhibition of apoptosis caused by binding of FBM to second binding pair
inhibition of apoptosis caused by binding of FBM to second binding pair
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CD40 transmembrane domain; CD40 cytoplasmic domain; CD40; CD40t/c; PCR;

Primers shown in AAA51858-59 were designed based on areas of sequence conserved in the human, mouse and bovine CD40 genes. A fusion protein consisting of the extracellular domain of human CD14s coupled to mouse Ig kappa light chain was able to bind to porcine CD40, indicating that direct signalling between a porcine graft and the immune cells of a human cost is possible through this molecular pathway. CD40-deficient donor mammal cells, tissues or organs may be used for xenografting in order to ameliorate cellular graft rejection in the recipient mammal. In particular, porcine cells, tissues or organs are genetically modified so that the cell surface expression of CD40 antigen is reduced. Transgenic pigs may have an inactivated CD40 antigen gene and a transgenic command cells, tissues or organs may be used as transplants donor mammal cells, tissues or organs may be used as transplants have a ceduced immunogenicity because the CD40 antigen gene is inactivated
                                                                                                                                                                     ö
libraries for target antigens e.g., tumour epitopes. Preferably, the FBM are expressed as fusion proteins with the signalling portion (the transmembrane and cytoplasmic) of CD40 (CD40L/C). The present sequence is a PCR primer used in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ameliorating cellular graft rejection in a recipient mammal using CD40-deficient donor mammal cells, tissues or organs as a xenograft, comprises inactivation of the CD40 antigen gene with a targeting vector.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Protein, useful for preparing a composition for modulating CD40-CD154 interactions in an individual for treating chronic inflammatory disease, cancer, atherosclerosis or acute injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to substantially pure CD40 splice variant proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  which include tail sequences. Also disclosed is a pharmaceutical composition comprising the protein and a carrier, an in vitro method of detecting whether an individual is expressing the protein, and a method for modulating CD40-CD154 interactions in an individual. The protein of the invention is useful for preparing a composition for modulating CD40-CD154 interactions in an individual for treating chronic inflammatory disease, cancer, atherosclerosis or acute injury. The current sequence represents a PCR primer for amplifying CD40 splice variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The invention relates to treating a kidney disease and involves transplanting a graft of human nephric tissue at a differentiation stage corresponding to 4-10 weeks of gestation of transplanting a graft of porcine nephric tissue at a differentiation stage corresponding to 3-6 weeks of gestation. The method is used for treating kidney disease and for evaluating transplant suitability. The kidney disease includes acute kidney failure, acute nephritic syndrome, analgesic nephropathy, a theroembolic renal disease, chronic kidney failure, chronic nephritis, atheroembolic syndrome, end-stage renal disease, Goodpasture's syndrome, Jay meanaglal proliferative glomerulonephritis, inferstitial nephritis, kidney cancer, kidney damage, kidney infection, kidney injury, kidney stones, lupus nephritis, membranoproliferative glomerulonephritis I, membranoproliferative glomerulonephritis, nephropanic diabetes insipidus, 184-mediated nephropathy, nephrogathy, nephroganic diabetes insipidus, 184-mediated nephropathy, nephrosis, nephropathitis, reflux membranoproliferative mephropathy, nephrosis, renal artery stenosis, renal artery embolism, renal artery stenosis, renal papillary necrosis, renal tubular acidosis type I, renal tubular acidosis type II, renal underperfusion and renal vein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Treating kidney disease e.g. chronic nephritis comprises transplanting human or porcine nephric tissue graft transplantation at differentiation stage corresponding to specific period of gestation.
                                                                                                                                                                                                                                                                                                          Kidney disease; transplantation; nephric tissue; nephrotropic; cytostatic; litholytic; antidiabetic; thrombolytic; CD40; PCR; primer;

The invention describes double-stranded (ds) DNA oligonucleotides (I) in which one strand (Ia) has any of 26 sequences (some degenerate), given in the specification, and the other strand is complementary to (Ia). Also described are the use of (a) ds oligonucleotides (II) that bind to the transcription factor AP-1 or (b) ds oligonucleotides (III) having any of a specified sequences (these include (I)) for preparing a composition for treatment or prevention of (i) acute or chronic transplant rejection and graft-versus-host disease or (ii) ischaemic/reperfusion injury to organs during surgery. (I), and other known ds oligonucleotides that bind to the transcription factor AP-1, are used to treat or prevent (i) acute or chronic transplant rejection and graft-versus-host disease or (ii) confour transplant rejection and graft-versus-host disease or (ii) acute or chronic transplant rejection and graft-versus-host disease or (ii) acute or chronic transplant rejection in cells, especially endothelial and antigen-presenting cells, e.g. by ex vivo treatment of donor organs before transplantation. (I) become active immediately after entering a cell, i.e. more quickly than antisense or interfering oligonucleotides. This sequence represents a reverse transcription PCR primer used in the isolation of human CD4U, used in an assay to determine the effect of ds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method for treating a disorder associated with pathological organ or tissue physiology or morphology. The method comprises transplanting into a subject a therapeutically offective mammalian organ or tissue graft, where the organ or tissue molecule capable of stimulating or enhancing an immune response in the subject, and so treating the disorder in the subject, also described: caubject, and so treating the disorder in the subject, and so treating the stage of differentiation of a mammalian organ or tissue most suitable for transplantation of a mammalian organ or tissue most suitable for transplantation of the organ or tissue into a mammalian subject. The method is useful in treating a disorder associated with pathological organ or tissue physiology or morphology, e.g., kidney, pancreatic, hepatic, metabolic, cardiac, haematological and/or genetic disorder; where the pancreatic disorder is especially diabetes. The present sequence represents a PCR primer used for the amplification of CD40 CDNA from human renal tissue, which is used in an example from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating organ or tissue disorders comprises transplanting into a subject a human or porcine organ or tissue at a stage of differentiation corresponding to 5-16 weeks (human) or 20-63 days (porcine) of gestation.
                                                                                                                                   organ disorder; tissue disorder; organ physiology disorder; organ morphology disorder; tissue physiology disorder; tissue graft; tissue morphology disorder; transplantation; organ graft; tissue graft; immune response; antidiabetic; cardiant; hepatotropic; immunosuppressive; nephrotropic; cell therapy; kidney disorder; pancreatic disorder; hepatic disorder; metabolic disorder; cardiac disorder; diabetes; cardiac disorder; diabetes;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2.4%; Score 24; DB 13; Length 24; 100.0%; Pred. Primers (AAQ55223-30) are used to amplify the human CD40 antigen and the human B7 DNA. The CD40 antigen is immunoreactive with an anti- CD40 MAD. The binding of the MAD to the CD40 antigen is located on the surface of human B cell. The antibodies can be used to treat transplant rejection diseases as well as autoimmune infections.                                                                                                                                         Antibodies to membrane-associated antigens - used for treating transplant rejection, graft-versus-host disease, antibody-mediated disease and auto-immune disease.
                                                                                                                                                                                               Primers (AAQ55223-30) are used to amplify the human CD40 antigen and the
                                                                                                                                                                                                       human B7 DNA. The CD40 antigen is immunoreactive with an anti- CD40 MAb. The binding of the MAb to the CD40 antigen is located on the surface of human B cell. The antibodies can be used to treat transplant rejection diseases as well as autoimmune infections. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PR field.)

The sequences represented by AAQ96201-096204 are used in the invention.

The sequences represented by AAQ96197 and AAQ96198 are primers for the full length B7-1. This sequence is also used (along with AAQ96200) as a primer for soluble B7-1. This sequence corresponds to bases 307-324 of the full length B7 gene. B7 is a monomeric transmembrane glycoprotein that is expressed on activated B-cells, and is a ligand for the CD28 receptor of T-cells. There are three ligands of B7 (B7-1, B7-2, and B7-3). The sequence amplified by these primers is inserted into a baculovirus vector and used for the production of B7-1 specific antibodies using hybridoma techniques. The anti-B7-1 antibodies can then be included in a composition containing an immunosuppressive agent that inhibits the production of interleukin-2 (IL-2) by T-cells. This composition can be administered to patients and thereby used to prevent transplant rejection, and to treat graft ve host disease (GVHD) and rheumatoid arthritis. The advantage with using this composition is that it induces long-lasting T-cell anergy against an alloantigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequences represented by AAQ96201-Q96204 are used in the invention. The sequences represented by AAQ96197 and AAQ96198 are primers for the full length B7-1. This sequence is also used (along with AAQ96200) as a primer for soluble B7-1. This sequence corresponds to bases 307-124 of the full length B7 gene. B7 is a monomeric transmembrane glycoprotein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Polymerase chain reaction; PCR; primer; amplify; B7; B-cell; T-cell; baculovirus vector; hybridoma; antibody; antigen; immunosuppressor; interleukin-2; IL-2; transplant rejection; graft vs host disease; GVHD; rheumatoid arthritis; therapy; CD28; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 immunosuppressive agent - used to prevent transplant rejection, and to treat graft vs host disease and rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                 ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     amino acids in its framework regions that are consistent with amino acid residues found in the corresponding framework regions of a human Ab to provide a reduced immunogenicity in humans. The present sequence represent a PCR primer used in an example of the present invention. The particularly immunoglobulin B (IgB) mediated allergies, systemic lupus erythematosus, primary biliary cirrhosis, idiopathic thrombocytopaenia purpura and rheumatoid arthritis. The MAb inhibits the normal B cell response to CD40 ligands at relatively low concentrations and is unlikely
that is expressed on activated B-cells, and is a ligand for the CD28 receptor of T-cells. There are three ligands of B7 (B7-1, B7-2, and B7-3). The sequence amplified by these primers is inserted into a baculovirus vector and used for the production of B7-1 specific antibodies using hybridoma techniques. The anti-B7-1 antibodies can then be included in a composition containing an immunosuppressive agent that inhibits the production of interleukin-2 (IL-2) by T-cells. This composition of interleukin-2 (IL-2) by T-cells. This transplant rejection, and to treat graft vs host disease (GVHD) and rheumatchd arthritis. The advantage with using this composition is that it induces long-lasting T-cell anergy against an alloantigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; B7 antigen; CD40; PCR primer; monoclonal antibody; B cell; growth;
differentiation; allergy; autoimmune disease; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (a)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A novel humanised monoclonal antibody (MAD) has been developed which: (a) binds a human CD40 antigen on the surface of a B cell, to prevent its growth and differentiation; and (b) has an effective number of exposed amino acids in its framework regions that are consistent with amino acid residues found in the corresponding framework regions of a human AD to provide a reduced immunogenicity in humans. The present sequence represent a PCR primer used in an example of the present invention. The MAD can be used to prevent or treat antibody mediated diseases, particularly immunoglobulin E (IgE) mediated allergies, systemic lupus erythematosus, primary blilary cirrhosis, idiopathic thrombocyptopaenia purpura and rheumatoid arthritis. The MAD inhibits the normal B cell response to CD40 ligands at relatively low concentrations and is unlikely
                                                                                                                                                                                                                                                                                                                           Human, B7 antigen, CD40, PCR primer, monoclonal antibody, B cell, growth,
differentiation, allergy, autoimmune disease; 88.

The sequences represented by AAQ96201-Q96204 are used in the invention.

The sequences represented by AAQ96197 and AAQ96198 are primers for the full length Br.1. This sequence is also used (along with AAQ96200) as a primer for soluble Br.1. This sequence corresponds to bases 307-324 of the full length Br gene. Br is a monomeric transmembrane glycoprotein that is expressed on activated Br-cells, and is a ligand for the CD28 creceptor of T-cells. There are three ligands of Br (Br.1, Br.2, and Br.3). The sequence amplified by these primers is inserted into a baculovirus vector and used for the production of Br.1 specific antibodies using hybridoma techniques. The anti-Br.1 antibodies can then be included in a composition containing an immunosuppressive agent that inhibits the production of interleukin-2 (IL-2) by T-cells. This composition can be administered to patients and thereby used to prevent transplant rejection, and to treat graft vs host disease (GVHD) and rheumatoid arthritis. The advantage with using this composition is that induces long-lasting T-cell anergy against an alloantigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, B7 antigen, CD40, PCR primer; monoclonal antibody, B cell; growth,
differentiation; allergy; autoimmune disease; 88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Primers (AAQ55223-30) are used to amplify the human CD40 antigen and the human B7 DNA. The CD40 antigen is immunoreactive with an anti- CD40 MAb. The binding of the MAb to the CD40 antigen is located on the surface of a human B coll. The antibodies can be used to treat transplant rejection diseases as well as autoimmune infections. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PR field.)

A novel humanised monoclonal antibody (MAb) has been developed which: (a) binds a human CD40 antigen on the surface of a B cell, to prevent its growth and differentiation, and (b) has an effective number of exposed amino acids in its framework regions that are consistent with amino acid provide a reduced immunogenicity in humans. The present sequence represent a FCR primer used in an example of the present invention. The MAb can be used to prevent or treat antibody mediated diseases, particularly immunoglobulin B (IgE) mediated allergies, systemic lupus erythematosus, primary biliary cirrhosis, idiopathic thrombocycopaenia purpura and rheumatoid arthritis. The MAb inhibits the normal B cell response to the concentrations and is unlikely
                                            Humanised monoclonal antibody binding CD40 antigen on B cells - to prevent their growth and differentiation, useful to treat or prevent antibody mediated allergies and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 34 BP; 4 A; 12 C; 12 G; 6 T; 0 U; 0 Other;

Jia X,

New chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates human CD40, useful for enhancing an immune response in a human, or treating cancer, HIV, neutropenia or viral infections.

Example 14; SEQ ID NO 135; 177pp; English.

The invention relates to a novel chimeric or human monoclonal antibody or

```
its antigen-binding portion that specifically binds to and activates human CD40. The anti-CD40 antibody of the invention demonstrates sytosetalic, virucide, antibacterial, immunostimulant and anti-HIV activities and may be useful for treating a hyperproliferative disorder such as cancer, viral and bacterial infection or genetic, primary or combined immunodeficiency conditions including neutropenia or HIV infection. The anti-CD40 antibodies may also be useful for detecting CD40 in a biological sample in vitro or in vivo, as well as during gene therapy procedures. The current sequence is that of the human anti-CD40 antibody-related PCR primer of the invention.

Identifying compounds which modulate expression of nucleic acids, used to provide compounds having defined physical, chemical or bioactive properties, e.g. antisense activity.

Example 10; Page 84; 264pp; English.

A method has been developed of defining a set of compounds that modulate the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, and according to defined criteria. Also described are: (1) a method of defining a set of oligonuclectides (ONS) that modulate the expression of a tNA sequence via binding of the ONS with the tNA sequence comprising generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual ONS with the tNA seconding to defined criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria, and (2) a method of defining a set

```
of compounds that modulate the expression of a tNA sequence via binding of the compounds with the tNA. The methods can be used for the generation and identification of synthetic compounds having defined physical, chemical or bioactive properties. Information gathered from assays of such compounds is used to identify nucleic acid sequences that are tractable to a variety of nucleotide sequence-based technologies, e.g. antisense drug discovery and target validation. AAZ40852 to AAZ41220, and AAY52701 to AAX5706, represent sequences used in the exemplification of the present invention

used to Identifying compounds which modulate expression of nucleic acids, provide compounds having defined physical, chemical or bioactive properties, e.g. antisense activity.

Example 10; Page 84; 264pp; English.

A method has been developed of defining a set of compounds that modulate the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, and evaluating to defined criteria. Also described are: (1) a method of defining a set of oligonucleotides (ONS) that modulate the expression of a tNA sequence via binding of the ONS with the tNA sequence via binding of the ONS with the tNA sequence comprising generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual ONS with the tNA sequence comprising criteria, and evaluating in silico the binding of the virtual ONS with the tNA sequence that modulate the expression of a tNA sequence via binding

Inhibition of CD40 is used to treat or prevent immune-associated diseases (specifically guest vs. host disease, allograft rejection or autoimmune diseases); inflammation (specifically asthma, rheumatoid arthritis, allograft rejection, inflammatory bowel disease or psoriasis) or hyperproliferation (specifically cancer and tumnours). the antisense oligonucleotides are also useful as diagnostic and research reagents. AAZ47776 represents the human CD40 mucleotide sequence. AAZ47770 to AAZ47772 represent human CD40 forward and reverse PCR primers, and a human CD40 FCR probe , respectively. AAZ47773 to

                                                                                                                                                           AAZ47685 to AAZ47768 represent phosphorothioate antisense oligonucleotides targeted to human CD40, which can be used to inhibit the expression of human CD40. CD40 is involved in lymphocyte activation, tumour growth and/or angiogenesis. Inhibition of CD40 is used to treat or prevent immune-associated diseases (specifically guest vs. host disease, allograft rejection or autoimmune diseases); inflammation (specifically carbma, rheumatoid arthritis, allograft rejection, inflammatory bowel disease or psoriasis) or hyperproliferation (specifically cancer and tumours). the antisense oligonucleotides are also useful as diagnostic and research reagents. AAZ4776 represents the human CD40 nucleotide sequence. AAZ47770 to AAZ47772 represent human CD40 forward and reverse PCR primers, and a human CD40 PCR probe, respectively. AAZ4773 to AAZ47775 represent invention
                                                                                                       ö

The invention discloses a method for increasing the expression of costimulatory molecules, such as CD40, and major histocompatibility complex (MHC) class I and class II antigens in tumour cells in vitro. The method comprises contacting the timour cells with deacetylase inhibitor (DAI). Tumourogenesis is related, in part, to the failure of the immune system to reject spontaneously arising tumours by responding appropriately to tumour antigens. Induction of T lymphocytes is considered to be a critical initial step and T cell activation requires an antigen specific signal, which involves the antigenic peptide and the management of themson and I proceins. The increased expression of these molecules increases the immunogenicity of tumours and their susceptibility to lysis. The inhibitors of deacetylation, at low concentrations, produce little or no apoptosis and maintain a normal cell cycle. The expression of machon and cell lysis on cells is induced. The DAIs are preferably trichostatin A (TSA) or sodium butyrate. The sequence presented is a real time PCR probe used to detect expression levels of the human CD40 gene
                                                                                                  Human; 88; PCR; probe; real-time PCR; costimulatory molecule; CD40; major histocompatibility complex; MHC; class I; class II; antigen; tumour; deacetylase inhibitor; DAI; tumourogenesis; immune system; T lymphocyte; T call activation; immunogenicity; antigen presentation; cell lysis; trichostatin A; TSA; sodium butyrate; cytostatic; CD40.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to selecting a target molecule that has an affinity for a ligand that is equal to or greater than a baseline affinity.

Comprises introducing a target molecule into a test mixture of the ligand and a standard target, introducing the test mixture into a mass spectrometer and identifying any complexes of the target molecule and the ligand. Also included are a method of detecting a ligand-arget complex having an affinity as expressed as a dissociation constant of nanomolar.

100 millimolar, a method for determining the relative interaction between at least two molecules determining target a ligand, a method of determining the ralative proximity of binding sites for a first target molecule and a second target molecule with respect to a ligand, a method of determining the relative proximity of binding sites for a first target molecule and a second target molecule on a ligand, a method of determining the relative orientation of a first target molecule to a second target molecule when bound to a ligand, a method for screening the binding bidings it arget molecule for a ligand, a method for refining the binding of a target molecule for a ligand, a method for refining the binding of a target molecule for a ligand, a method for refining the binding of a target molecule for a ligand, a method for refining an alternate structure
                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Selecting a target molecule having affinity for a ligand that is equal to/greater than a baseline affinity by introducing a target molecule into a ligand and standard target test mixture and identifying complex by mass

Compuries a nucleotide sequence that corresponds to a portion of the nucleotide sequence of a larger oligomeric compound that comprises a comprises a nucleotide sequence of a larger oligomeric compound that comprises a stemnloop structure), a method of modulating transcription in a cell, a method of modulating a conversion of a precursor RNA into a microRNA in a cell, a method of generating a set of (oligomeric) compounds that modulate the expression of a target nucleic acid molecule, a computer formatted medium comprising computer readable instructions for identifying active compounds or for performing the method above, a method of predicting evolutionarily allowed mutations of a microRNA, a method of grouping biological members according to a grouping criteria, a method of grouping biological members according to a grouping criteria, a method of determining a proup of probable mutations for a microRNA. The methods of the invention may be applied to the design of siRNA (short interfering RNA) and antisense oligomicleotides. The method is useful for determining the mode of binding interaction between two or more target molecules to the ligand as well as their relative affinities. The deligoneric compounds are useful in drug discovery and target validation, and allowed more target moteric manneric method in drug discovery and target validation, and which are useful in drug discovery and target validation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
of an oligomer, a method for identifying a ligand that alters a target compound secondary structure, a method of determining the relative change in proximity of binding sites for a first ligand and a second ligand on a target substrate influenced by the first ligand, a method of determining the relative change in proximity of a first binding site for a binding ligand and a second binding site for a second binding ligand on a target, a method of determining the relative orientation of a first ligand to a second ligand when bonding to a target substrate, an oligomeric compound comprising a nucleotide sequence at least 80% complementary to a target RNA (where the oligomeric compound comprises 21-24 nucleotides, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              diagnostics, therapeutics, prophylaxis and as research reagents and kits. The present sequence is an RT-PCR (reverse transcriptase PCR) primer for human CD40 mRNA used to assess expression of CD40 during treatment with

Selecting a target molecule having affinity for a ligand that is equal to/greater than a baseline affinity by introducing a target molecule into a ligand and standard target test mixture and identifying complex by mass spectrometer

Example 65; SEQ ID NO 152; 314pp; English.

The invention relates to selecting a target molecule that has an affinity comprises introducing a target molecule into a test mixture of the ligand that is equal toor greater than a baseline affinity comprises introducing a target molecule into a test mixture of the ligand and a standard target, introducing the test mixture into a mass comprises introducing a target molecule and the ligand and a fathinty as expressed as a discociation content of manomolar.

Igan, Also intoluded are a method of detecting a ligand-target complex having an affinity as expressed as a discociation content of manomolar.

100 millimolar a method for determining the relative interaction between a ligand, a method of determining the relative ortentation of a first regret molecule with respect to a ligand, a method of determining the relative created target molecule for bigand, a method for a first target molecule for a ligand, a method for screening target molecule for a ligand, a method for modulating the binding of a target molecule for a ligand, a method for screening target molecule for a ligand, a method for screening target molecule for a ligand, a method for screening target molecule for a ligand, a method for screening target molecule for a ligand, a method for screening target compound secondary structure, a method for screening the relative change in proximity of a first ligand that alters a target compound secondary structure, a method of determining the relative ortenacion of a first ligand on a target compound secondary structure, a method of method screening the relative ortenacion of a first ligand on a second ligand when bound to a research binding site for a binding site for a binding class on objective sequence of a larger ortenacion of a first ligand on a second ligand when bound to a rarget unberrace, an objective sequence of a larger orientation of a first ligand on the ligand when bound to a carget unberrace of a larger orientation of a second binding since for a second binding since for a second binding of compute diagnostics, therapeutics, prophylaxis and as research reagents and kits. The present sequence is an RT-PCR (reverse transcriptase PCR) primer for human CD40 mRNA used to assess expression of CD40 during treatment with antisense oligonucleotides targeted to the human CD40 gene, designed according to the methods of the invention.

RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for stracted from leaf strips, double digested using was extracted from leaf strips, double digested using BamHI and BgIII, and ligated to form circular plasmids.
DH10B cells were transformed and then screened on LB
